Coast of California, with 100 phis. humpback oil. The bark Martha returned from a cruise about this group, during which she has taken '90 bbis. sporm oil, which at pressent prices will probably real e as much as the average of the

The arctic is being unladen with great dispatch, and will commence taking in her return cargo of oil and Island produce the first of the week, of which she has a full cargo awaiting her, and will sail on or about the 4th April. The barks Comet and A. A. Eldridge are both loading produce and will sail in all of next week.

Our coasters are all busily employed bringing produce from the other islands, and the spring trade promises to be brisk. Market quotations stand as last reported.

NEW BEDFOLD OIL MARKET.

(From the New Bedford Standard, Jan. 29.) The oil market the past week has been more quiet, although there is considerable inquiry for both home use and export. We hear of sales of 1000 bbls., sperm oil at \$1.55 per gallon and 500 bbls., whale oil at \$1.10 per gallon.

Parnot sex .- The rapid extent to which the Petroleum trade of the country has increased within a few years past has added materially to our national wealth, and has probably contributed more than any other source to swell our national commerce. American rock-oil is now experted to almost every quarter of the globe. From the first of January until the close of October, 1862, there were 5,195,481 gallons shipped from New York alone. For the same period this year New York has exported 15.503,-196 gallons; Baltimore, 806,961 gallons. The increase of the New York trade from over five to over fifteen million gallons in a single year may be taken as a fair average of the increased shipments of the other ports, and shows how rapidly the traffic is being developed. In r und numbers, the total value of the exports from January 1 until the close of October, will not tall short of ten millions of dollars; so that hereafter petroleum is fairly entitled to rank among the staples of the country.-Boston Bulletin

MEMORANDA.

REPORT OF THE BARK ARCTIC .- Left Boston Sept. 30th, and had moderate breezes and pleasant weather leaving the coast. Crossed the Equator in the Atlantic in 29 ° W. long., 41 days from Boston, having no S. E. trades. Was 43 days from the Equator to lat. 50 ° South, and had very severe weather, with heavy gales and rough sea. Had 92 days to Cape Horn, and a succession of gales from W. N. W. to W. S. W. Was 31 days of there. From the Cape to lat. 40 ° S. South Pacific, had strong N. W. gales, thence to lat. 25 ° S. light northerly winds. Took the S. E. trades in lat. 24° S., and crossed the Equator in long. 126 ° W., had the trades light. Were 146 days. Took the N. E. trades in lat. 8° North, and after passing lat. 16° N. had light northerly winds and calms. On the 11th saw Hawafi bearing S. W. by S., and East end of Maui W. by S., and on the 12th came into Honolulu.

In lat. 7° 20' N., long. 26° 22' W. exchanged signals with the Bremen bark Javerland, 42 days from Bremen for Rangoon. Lat 56° S., long. 69° W. passed the American ship Success standing to the westward.

Vessels Expected from Foreign Ports.

supposed she encountered gales and put back to port. Haw sch Onomea, Way, sailed from Boston August 7, with a cargo of general moise to Aldrich, Walker & Co. -shortly

expected.

Am bark Arctic, Hammond, was to leave Boston about October
1, with general mise to C. Brewer & Co.

Haw bark R. W. Wood, Gherken, sailed from Bremen Nov.

8, with indee to H Hackfeld & Co.

Eng ship Brechin Castle, sailed from Glasgow, Scotland, Oct.

3, for Honolulu, via Otago, N Z, with machinery to Castle & Cooke for the Kohala Plantation, and to Aldrich, Walker & Co., for the Onomea Plantation.

Commercial Advertiser.

SATURDAY, MARCH 19. THE subject of the preservation of the forests. and the planting of trees, is one which claims the attention of every person who feels an interest in the future prosperity of this country; and especially should it interest those who compose the Government; for it is right to suppose that they regard not only the interests of the present, but of the future also; and not only the welfare of themselves, their friends and neighbors, but of the whole community. It will be a happy thing for the country, if they or others can do anything in this matter that shall lead to proper action on the part of land-holders. That there is reason for solicitude, the following remarks and extracts will show.

It is a fact too well known by intelligent people of the present day, to need reasserting here, that forests, especially on the hill-tops and windward slope of mountains, have a great influence upon the supply of water to the land, by increasing the condensation of the moist atmosphere driven across the land by the winds, by keeping down the temperature and thereby attracting the passing clouds, and by shading the ground and covering it with leaves which check evaporation and give time to the rain to soak into the porous earth and rocks, to find its way to the surface again at some lower point, in life-giving springs

It is noticed by old residents, that in some parts of these islands, severe droughts are more frequent of late years than in former times, and that in many places there is much greater risk in planting than there was a few years ago. In early times, before the fleet of whalers and other vessels were here supplied with wood, before the city of Honolulu with its bakeries and hundreds of cooking stoves, annually burning cargoes of wood and charcoal, was built, and before sugar plantations, each consuming hundreds of cords of wood per annum, had been commenced, the amount of wood used was very small indeed, and the forests were undoubtedly on the increase.

There are many remains of old water courses, and signs of cultivation with irrigation, in places where now no water could be procured to run in those old auwais, were they to be put in repair again. In "old times" there were no herds of wild or tame cattle and flocks of goats roaming the woodlands and hill-tops to break down, eat and otherwise destroy the young wood springing up from seed or root. From these causes and from the constant cutting down of young trees | the loss of our forests and trees. If, howfor fuel and firewood, the streams on this island have sensibly decreased in volume, even during the time of our older inhabitants.

The consumption of wood, especially on the sugar plantations, is greatly on the increase, and the destruction of young shrubs and trees by cattle, horses, and almost worthless goats, is constantly going on : and the gatherers of fungus are lending efficient aid in the general waste. The amount of wood used and destroyed by some single sugar plantations is astonishing, and will strip a large forest in a few years; and this fact ought to lead the proprietors of those plantations, and everbody in their vicinity, to the adoption of measures for economizing and protecting the living trees, and for planting seeds of trees ONE IRON SUGAR MILL. on hillsides and other places not cultivated. The woodland might be fenced so as to keep out cattle; and with concert of action on the part of owners of lands running to the tops of the ranges, the goats could be hunted out and killed

The Pride of India and Algeroba trees grow quickly when protected, make good fuel and timber for fences, buildings, &c., and bear the dry weather well, and the former grows very rapidly in a moist soil, as may be seen in Hilo and in Kona, Hawaii / And there are many other kinds of valuable trees that grow quickly in sheltered places, and when planted close together, protect each other and form tall and useful trunks, valuable either for fuel, houses or ship timber.

A sugar plantation cannot be carried on at all without fuel and water, and cannot be made profitable without cheap fuel, cheap labor, and considerable water. Having no coal mines in this country, we must rely upon wood for fuel, and with a continuance of the present mismanagement wood must every year decrease in quantity and increase in value. The cost of labor is dependent upon the expenses of living, in which food is an important item; and food cannot be produced cheaply without frequent rains and a good supply of running water, and if the land is stripped of the living wood, the supply of water will fail.

The eminent Hungarian agriculturist, Ladislaus von Korizmick, at the recent meeting of E agarian physicians and naturalists in Pesth, read a paper on the present drought in Hungary. After first pointing out that the meteorological conditions in 1790, were the same as those of the present year, he stated the want of plantations of trees and the unequal division of water, to be the chief reasons of this misfortune. Of the entire country of Hungary, only 22.66-at most 23-parts are planted with trees, which in itself would not be so bad a proportion, were the plantations not so unequally divided. In the Marmarose Comitate, for instance, about 23 parts of the soil are planted with trees; while in the Theiss provinces only about 0.03 have any at all. By detailed statistical items, the lecturer farther proved incontestably the close relation of treeplantations and the distress in special countries.

The following extracts from an article on " Failure of Springs in the East," published in Chamber's Magazine for July, 1863, contain

many notorious facts bearing up this subject :
"Among all the departments of atural philosophy, none, perhaps, is more obscure than that which concerns the origin and history of springs ; yet, to these hidden sources, to these small, sweet reservoirs of moisture, to these wayward children of uncertain parents, must be traced all the fertility and beauty of the earth.

"With rivers so immense, (as the Nile, Ganges, etc.,) man cannot greatly interfere, but with smaller streams he may, and that so effectually, as, in the course of time, to dry them up, and convert into a desert the lands they once fertilized. In Greece, where the mountains are generally of moderate elevation, rivers, formerly large, have been rendered diminutive, while smaller ones have been totally lost. * * * In that part of Europe nature has changed in the most striking manner. Districts once covered with rich harvests, orchards, vineyards, olive groves, are now mere expanses of dust, or naked rocks or arid unsightly flats. Going further east, we find throughout the greater part of Persia immense tracts of old, highly productive lands, now smitten with barrenness, destitute of springs, and deserted by the inhabitants.

become a desert, from which the peasants have fled.

because the springs on which their living depended failed one after another. Similar phenomena have displayed themselves in our island-settlement of Mauritius and Penang, where, owing to the great value of land, the growth of the soil speedily attracted the notice of government, and led to the adoption of the proper remedy. It was observed in the latter island that the Chinese squatters, who could not be expected to comprehend the laws of nature, or to be guid ed by considerations of patriotism, cut down the jungle on the summits and slopes of the hills, upon which the springs suddenly dried up, and, except during the monsoons, no moisture was left in the disforested districts.

"When we took the Mauritius from the French, our enterprising colonists thought it a pity that the fine rich soil found on the tops of hills should be given up to the support of what they considered useless woods; so they cut down the trees and replaced them by cultivated fields. Very shortly it was noticed that the streams were shrinking; that one stream after another disappeared; that the green of the meadows was changed to a dusty brown; and that the earth, in short, ceased to be productive. Reflecting persons were not slow in discerning the cause of this great change, they noticed that the periodical rains, however abundant they might be, soon cleared away from the cultivated country, leaving it exposed to the rays of a fiery sun, which scorched and withered up everything for want of a perennial supply of moisture. The next step was with all possible speed to reclothe the mountains with forest and jungle, upon which experience had proved the fertilty of the lower lands depended. Since then, we believe, the action of the colonists and Chinese squatters has been checked, while all the land on the crests of lofty hills and mountains has been retained n the hands of government to be devoted to forest. Throughout Southern India, a similar policy has been forced upon the rulers by the urgent necessity of the case. "To ignorant Asiatics, the desiccation of springs is attributed

to the wrath of certain divinities, provoked by the invasion of their sacred retreats; but Europeans, looking up to the neighboring hills, discover in their naked and barren aspect the true cause of the phenomena.

"As far back as the sevententh century, a Persian nobleman onversing one day with a European traveler, assured him that within a comparatively few years no less than four hundred springs had failed in the smail province over which he ruled. It never occurred to him that by such a statement he was accusing himself of gross or criminal neglect, since he saw the materials of fountains daily moved from the heights, where they flourished for ages, to heat the ovens, or, in the kitchens of the wealthy, to roast kids and lambs for their sustenance. When there existed a government in the land worthy of the name, things were very different; then groves were planted on eminences; then the banks of streams were fringed with woods; then the crests of chains and ridges gloried in their primeval forests. which sheltered beasts of the chase, and formed the favorite resort of the intrepid hunter and of the meditative safi. Low down on the slopes of the hills, lovely orchards and rose-gardens charmed the sight, with rills flowing between them, and bearing to mosques and pleasure houses those refreshing ablutions in which the children of the Prophet so greatly delight. * * * But these beauties, once common, are now few and far between. * Most of the uplands are now bare, barren, stony, and dry, so that for many days he (the traveler) finds nothing to drink but the water he carries along with him in a leathern sack. * * To prove that it anciently was not so, we observe in the most deserted districts the remains of canals and bridges and ornamented fountains where not one drop of

water has been beheld for ages.
"We dwell upon the state of Persia because it affords the most striking exemplification of the evils brought by an ignorant government upon mankind." Our space will not permit us to copy the entire article, which is long but very interesting. We wish the importance of the subject could be impressed on our planters and agriculturists, now, before our islands suffer any more from ever, the prospective interests of the country continue to be sacrificed to present service, the time will soon come when legislation must be had on this subject, and fuel will have to be obtained from other sources. This affords a good subject for discussion before the Planters' Association, which is soon to be organized to consider questions pertaining to our agriculture.
